**Note:** This tutorial assumes that you have completed the previous tutorials: creating a ROS package (/ROS/Tutorials/CreatingPackage).

Figure 1. Please ask about problems and questions regarding this tutorial on ● answers.ros.org (http://answers.ros.org). Don't forget to include in your question the link to this page, the versions of your OS & ROS, and also add appropriate tags.

# Building a ROS Package

**Description:** This tutorial covers the toolchain to build a package.

**Tutorial Level: BEGINNER** 

Next Tutorial: Understanding ROS Nodes (/ROS/Tutorials/UnderstandingNodes)

catkin rosbuild

#### Contents

- Building Packages
  - 1. Using catkin\_make
  - 2. Building Your Package

## 1. Building Packages

As long as all of the system dependencies of your package are installed, we can now build your new package.

**Note:** If you installed ROS using apt or some other package manager, you should already have all of your dependencies.

Before continuing remember to source your environment setup file if you have not already. On Ubuntu it would be something like this:

```
$ source /opt/ros/%YOUR_ROS_DISTRO%/setup.bash
$ source /opt/ros/kinetic/setup.bash (For Kinetic for instance)
```

### 1.1 Using catkin\_make

catkin\_make (/catkin/commands/catkin\_make) is a command line tool which adds some convenience to the standard catkin workflow. You can imagine that catkin\_make (/catkin/commands/catkin\_make) combines the calls to cmake and make in the standard CMake workflow.

#### Usage:

```
# In a catkin workspace
$ catkin_make [make_targets] [-DCMAKE_VARIABLES=...]
```

For people who are unfamiliar with the standard CMake workflow, it breaks down as follows:

Note: If you run the below commands it will not work, as this is just an example of how CMake generally works.

```
# In a CMake project
$ mkdir build
$ cd build
$ cmake ..
$ make
$ make install # (optionally)
```

This process is run for each CMake project. In contrast catkin projects can be built together in workspaces. Building zero to many catkin packages in a workspace follows this work flow:

```
# In a catkin workspace
$ catkin_make
$ catkin_make install # (optionally)
```

The above commands will build any catkin projects found in the src folder. This follows the recommendations set by REP128 (http://ros.org/reps/rep-0128.html). If your source code is in a different place, say my\_src then you would call catkin\_make like this:

**Note:** If you run the below commands it will not work, as the directory my\_src does not exist.

```
# In a catkin workspace
$ catkin_make --source my_src
$ catkin_make install --source my_src # (optionally)
```

For more advanced uses of catkin\_make (/catkin/commands/catkin\_make) see the documentation: catkin/commands/catkin\_make (/catkin/commands/catkin\_make)

### 1.2 Building Your Package

For readers of this page who are about to build your own codes, please also take a look at later tutorial (C++) (/ROS/Tutorials/WritingPublisherSubscriber%28c%2B%2B%29)/(Python) (/ROS/Tutorials/WritingPublisherSubscriber%28python%29) since you may need to modify CMakeLists.txt.

You should already have a catkin workspace (/catkin/Tutorials/create\_a\_workspace) and a new catkin package called beginner\_tutorials from the previous tutorial, Creating a Package (/ROS/Tutorials/CreatingPackage). Go into the catkin workspace if you are not already there and look in the src folder:

```
$ cd ~/catkin_ws/
$ ls src

beginner_tutorials/ CMakeLists.txt@
```

You should see that there is a folder called beginner\_tutorials which you created with catkin\_create\_pkg (/catkin/commands/catkin\_create\_pkg) in the previous tutorial. We can now build that package using catkin\_make (/catkin/commands/catkin\_make):

```
$ catkin_make
```

You should see a lot of output from cmake and them make, which should be similar to this:

```
Base path: /home/user/catkin ws
Source space: /home/user/catkin ws/src
Build space: /home/user/catkin ws/build
Devel space: /home/user/catkin ws/devel
Install space: /home/user/catkin ws/install
####
#### Running command: "cmake /home/user/catkin ws/src
-DCATKIN DEVEL PREFIX=/home/user/catkin ws/devel
-DCMAKE INSTALL PREFIX=/home/user/catkin ws/install" in "/home/user/catkin ws/build"
####

-- Found gtest: gtests will be built
-- catkin 0.5.51
-- BUILD SHARED LIBS is on
-- ~~ traversing packages in topological order:
```

Note that catkin\_make (/catkin/commands/catkin\_make) first displays what paths it is using for each of the 'spaces'. The spaces are described in the REP128 (http://ros.org/reps/rep-0128.html) and by documentation about catkin workspaces on the wiki: catkin/workspaces (/catkin/workspaces). The important thing to notice is that because of these default values several folders have been created in your catkin workspace. Take a look with 1s:

```
$ ls

build
devel
src
```

The build folder is the default location of the build space (/catkin/workspaces#Build\_Space) and is where cmake and make are called to configure and build your packages. The devel folder is the default location of the devel space (/catkin/workspaces#Development\_.28Devel.29\_Space), which is where your executables and libraries go before you install your packages.

Now that you have built your ROS package let's talk more about ROS Nodes (/ROS/Tutorials/UnderstandingNodes).
